

Ziptrrip tech assignment

Challenge: Make a todo application

Frontend:

- Implement a basic react application. Application has to be Multiple page application (MPA) instead of SPA.
- Make one page for todos list. Add the necessary features here. (refer to online todo applications for feature ideas)
- Make a second page for a single todo item. This page should receive a query parameter of todo id and display the todo (plus any other information that you associate it with).

Backend:

- Implement a javascript / typescript based server.
- Create CRUD apis for todos.
- Save the data in a file or in a database. Either is fine.
- Write Unit tests (optional)
- Write Postman APIs / Rest Client files (optional)

Note:

- As long as it is javascript/typescript, you can choose whichever stack you prefer.
Eg. nodejs express + react + vite
Or Next js based stack
Or Bun based stack
Or Fastify based stack
- You are open to using AI as much as you want but be in control of the code.
- If you are a backend developer, making unit tests and Writing Post man or rest client files is mandatory

To qualify:

1. Check-in the code for the above problem in a git repository and share the repo link with us.
2. Document the features and functionalities. Undocumented features will not be considered.
3. Documentation has to be in `.md` files in the repository itself.

Extra points for:

1. Usage of typescript.

2. Usage of a database.
3. Coding organization. (arrangement of files and functions)
4. Unit Tests.
5. Postman APIs / Rest Client files
